

# PROGRAMMABLE TRANSMITTER

ATEX CE

- Input for RTD, TC, mV, linear resistance, mA, and V
- 3-port 3.75 kVAC galvanic isolation
- Current and voltage output
- Universal voltage supply
- 1- and 2-channel versions
- Loop supply > 18 V in Ex zone 0

#### **Application:**

Electronic temperature measurement with resistance sensor or thermocouple sensor. • Ex barrier for temperature sensors, potentiometers, and current / voltage signals • Ex power supply for 2-wire transmitters in zone 0, 1, and 2. • Amplification of mV signals. • Conversion of linear resistance variation. • Galvanic isolation of analogue signals. • Measurement of floating signals. • Linearisation of non-linear Ohm, mV, mA, or voltage signals. • Separation of circuits in PELV/SELV installations.

#### **Technical characteristics:**

The unit is based on a microprocessor core with an efficient program operation. The basic calibration data and present set-up are stored in an EEPROM thereby avoiding the loss or change of data at power off. The 2-channel version has a full galvanic isolation between the channels. By way of jumpers on the PCB the input in the standard version can be programmed either for a temperature or a current / voltage input. This means that one channel can work as for instance a temperature transmitter and the other can work as an isolation amplifier. Measurement range, signal parameters, and output span are configured to the present task by way of a Windows® 95/98-/NT-based PC and PR electronics A/S' communications interface Loop Link 5905.

#### **Input types:**

##### **Temperature input - jumpers in position 1:**

**Thermocouple input** (TC) for standard thermocouples type B, E, J, K, L, N, R, S, T, U, W3, W5 according to the norms IEC 584, DIN 43710 and ASTM E988-90.

The CJC can be selected in 3 different ways: internally in the terminal, externally by way of a Pt100 / Ni100 sensor, or externally with a constant temperature. If internal compensation is selected, a terminal with a built-in temperature sensor must be ordered separately (PR type no. 5910 and 5913). Sensor error detection is available.

**RTD input** for Pt100...Pt1000 according to the norm IEC 751 and Ni100...Ni1000 according to the norm DIN 43760. Automatic cable compensation at a 3 or 4-wire connexion. At a 2-wire connexion the cable resistance can be entered or measured by the configuration program and sent to the module which then compensates by the entered cable resistance. Sensor error detection is available.

**Resistance input** for resistance measurement with cable compensation as described under the RTD input. Sensor error detection is available.

The **mV input** is programmable in the range -150...+150 mV.

#### **Current / voltage input - jumpers in position 2:**

The **current input** is programmable in the range 0...100 mA, for instance 4...20 mA.

The **voltage input** is programmable in the range 0...250 VDC.

**Auxiliary supplies are selected in the configuration program:**  
Loop transmitter supply > 18 VDC.

Reference voltage of 2.5 VDC, for instance as a supply for potentiometers.

#### **Output:**

The analogue standard current / voltage output is programmable in the range 0...20 mA, for instance 4...20 mA and 0...10 VDC. The output voltage can be ordered for a maximum of 12 VDC by a special shunt resistance. The output signal is proportional and linear to the value of the input signal. Special set-ups can be selected in the configuration program, for instance a customised linearisation, a reversed output, a limiter according to the selected output span, and selection of an output value in case of a sensor error. Maximum load on the current output is 600 Ω. Minimum load on the voltage output is 500 kΩ.

#### **Loop 4...20 mA current output:**

By wiring the current signal alternatively, the output works as a loop output. If the supply voltage for the 5114 disappears, the output current drops to < 4 mA.

#### **Sensor error detection:**

The output can be set up at a RTD, thermocouple and linear resistance input to go to max., to min. or entered value at sensor error detection. If the output is set to 4...20 mA it is also possible to select NAMUR NE43 Upscale or Downscale.

#### **Configuration:**

The transmitter is configured to the present task by way of a Windows® 95/98-/NT-based PC and PR electronics A/S' communications interface Loop Link 5905. The transmitter can be configured with or without a connected supply voltage as the communications interface supplies the necessary voltage to the set-up. The communications interface is galvanically isolated to protect the PC port RS232. Communication is 2-way to allow the retrieval of the transmitter set-up into the PC and to allow the transmission of the PC set-up to the transmitter. For users who do not wish to do the set-up themselves, the 5114 can be delivered configured according to customer specifications: input type, measurement range, sensor error detection, and output signal.
